So What's The Problem?

- Internal market 'plumbing' in some markets
- Some markets show declines in average trade size – more trades to move the same dollar volume.
- No decline in overall secondary market trading – but some decline in the ratio of trades to outstanding securities.
  - But why should we expect trading volumes to grow with outstanding securities?
- Decline in balance sheet capacity for bank dealers.

Questions

- Transactional liquidity: Do internal market issues interfere with the flow of credit to the real economy?

- Systemic liquidity: effects during market stress?
  - Could a lack of 'shock absorption' capacity lead to more rapid price declines during a sell-off?

- What are the implications for regulation?

Regulation: Or Address Emerging Risks?

- Predatory electronic trading.
- Liquidity management and stress testing by asset managers and funds.
- These are on the regulatory agenda, but we have yet to see results.
